

Business Performance Dashboard

End-to-End Invoice Processing & Analytics | Microsoft Excel | Madhur Amlan Nayak | Aug 2026

Objective

Track how invoices move from received to payment and find where delays, exceptions and backlogs occur, in one interactive dashboard.

Data & Tools

- 500 invoice records, Jan-Dec 2020, across 4 regions and 5 users
- Excel: Pivot Tables, Pivot Charts, Slicers (region, user, month)
- Calculated fields for stage days, cycle time, exception and payment flags

Key Findings

- Payment is the slowest stage.** Posted → paid averages 6.07 days, about 60% of the 10.06-day end-to-end cycle. Created → posted averages 2.96 days.
- Half of all invoices carry an exception.** 49.4% were flagged. East has the highest rate (54.6%) and North the lowest (45.8%); by user, rates range from 43.3% to 55.7%.
- Backlog sits at the front of the process.** Of the 212 unpaid invoices, 111 are still waiting at the received → created stage and 101 at created → posted.
- Payment mix is close to even.** Of the 288 paid invoices, 149 (52%) were paid by ACH and 139 (48%) by check; cycle times are similar (10.0 vs 10.1 days).
- Volume and spend peak in Oct and Mar.** October is the busiest month (51 invoices, ₹137.9K); March follows (49 invoices, ₹127.2K). North (142) and East (141) handle the most invoices; East has the highest spend (₹379.7K).

Business Insights

- The analysis indicates that payment processing is the largest contributor to overall invoice cycle time.
- The workflow backlog is concentrated in the early stages of invoice processing, particularly the Received → Created stage.
- The high exception rate also indicates an opportunity to review invoice validation and exception-handling processes.

Headline KPIs

KPI	Value
Total invoices	500
Total invoice amount	₹1.27M (₹12.68 lakh)
Avg end-to-end cycle (paid invoices)	10.06 days
Avg posted → paid	6.07 days
Exception rate	49.4% (247 of 500)
Invoices still in workflow	212 (42%)
